# Outline

---

## 1. Introduction

1. Fraunhofer Institute for Industrial Mathematics (ITWM)
2. Acoustic Design Problem and Integrated Product Policy

## 2. Forward Simulation

1. Microstructure Generation
2. Flow Simulation
3. Absorption Simulation

## 3. Inverse Simulation

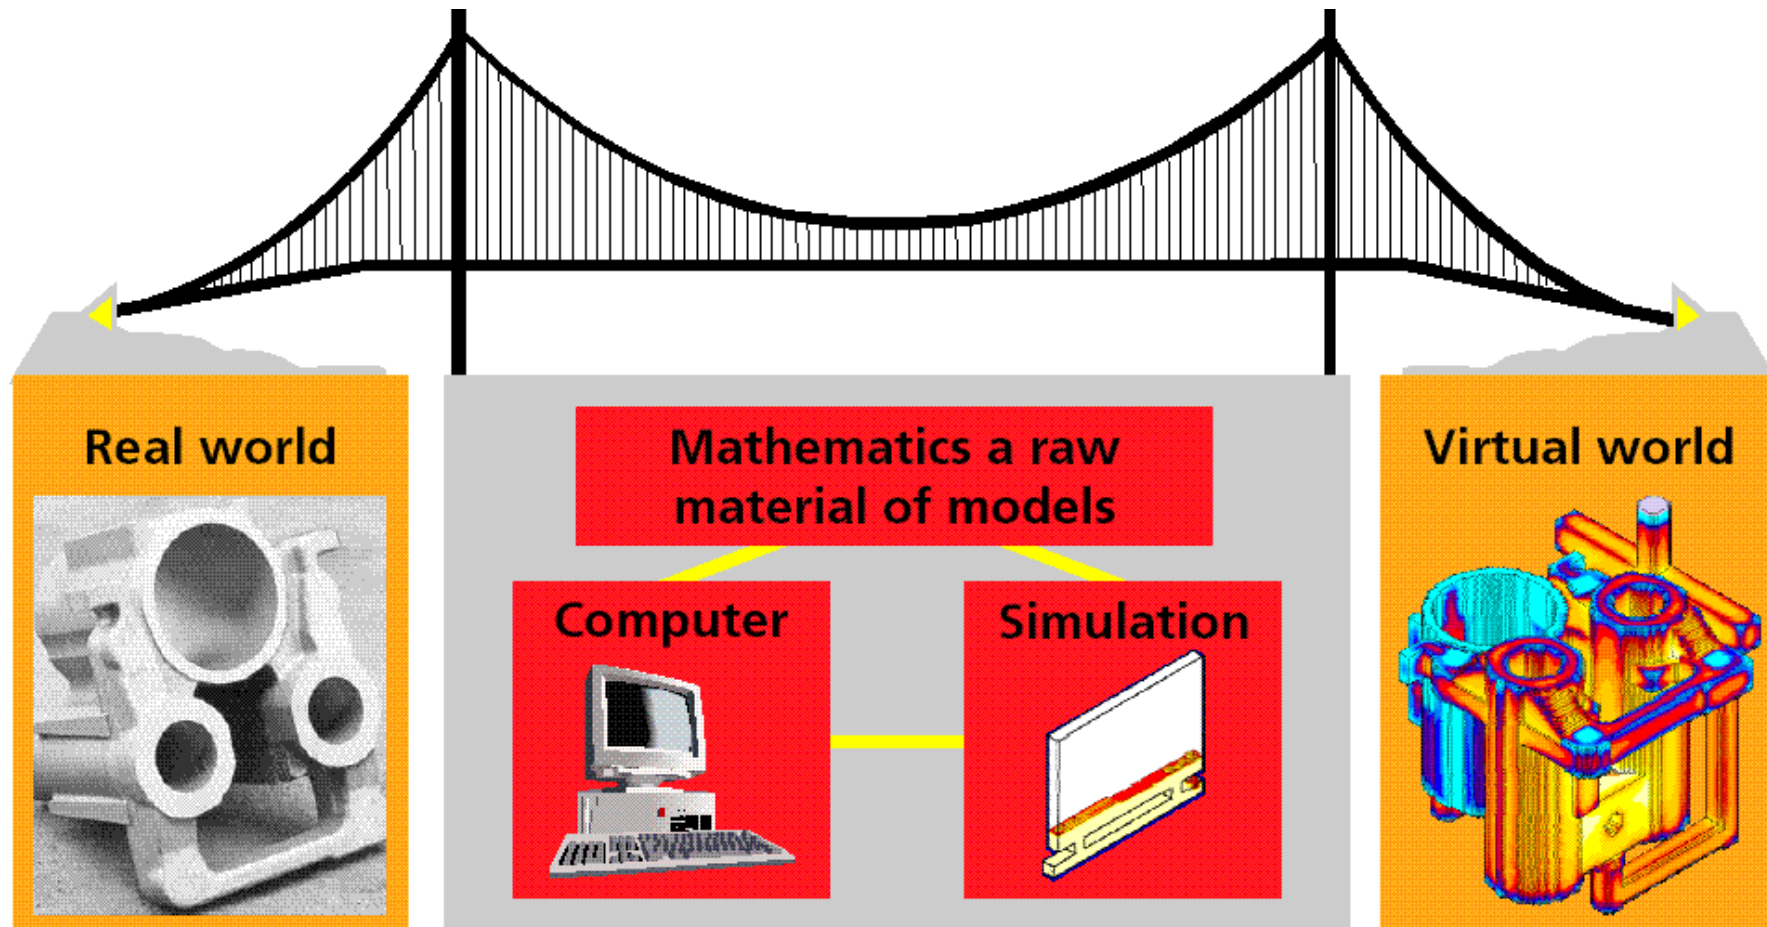

1. AutoSEA2 Computing of a Data Base
2. Solution of the Constraint Minimization Problem

## 4. Summary

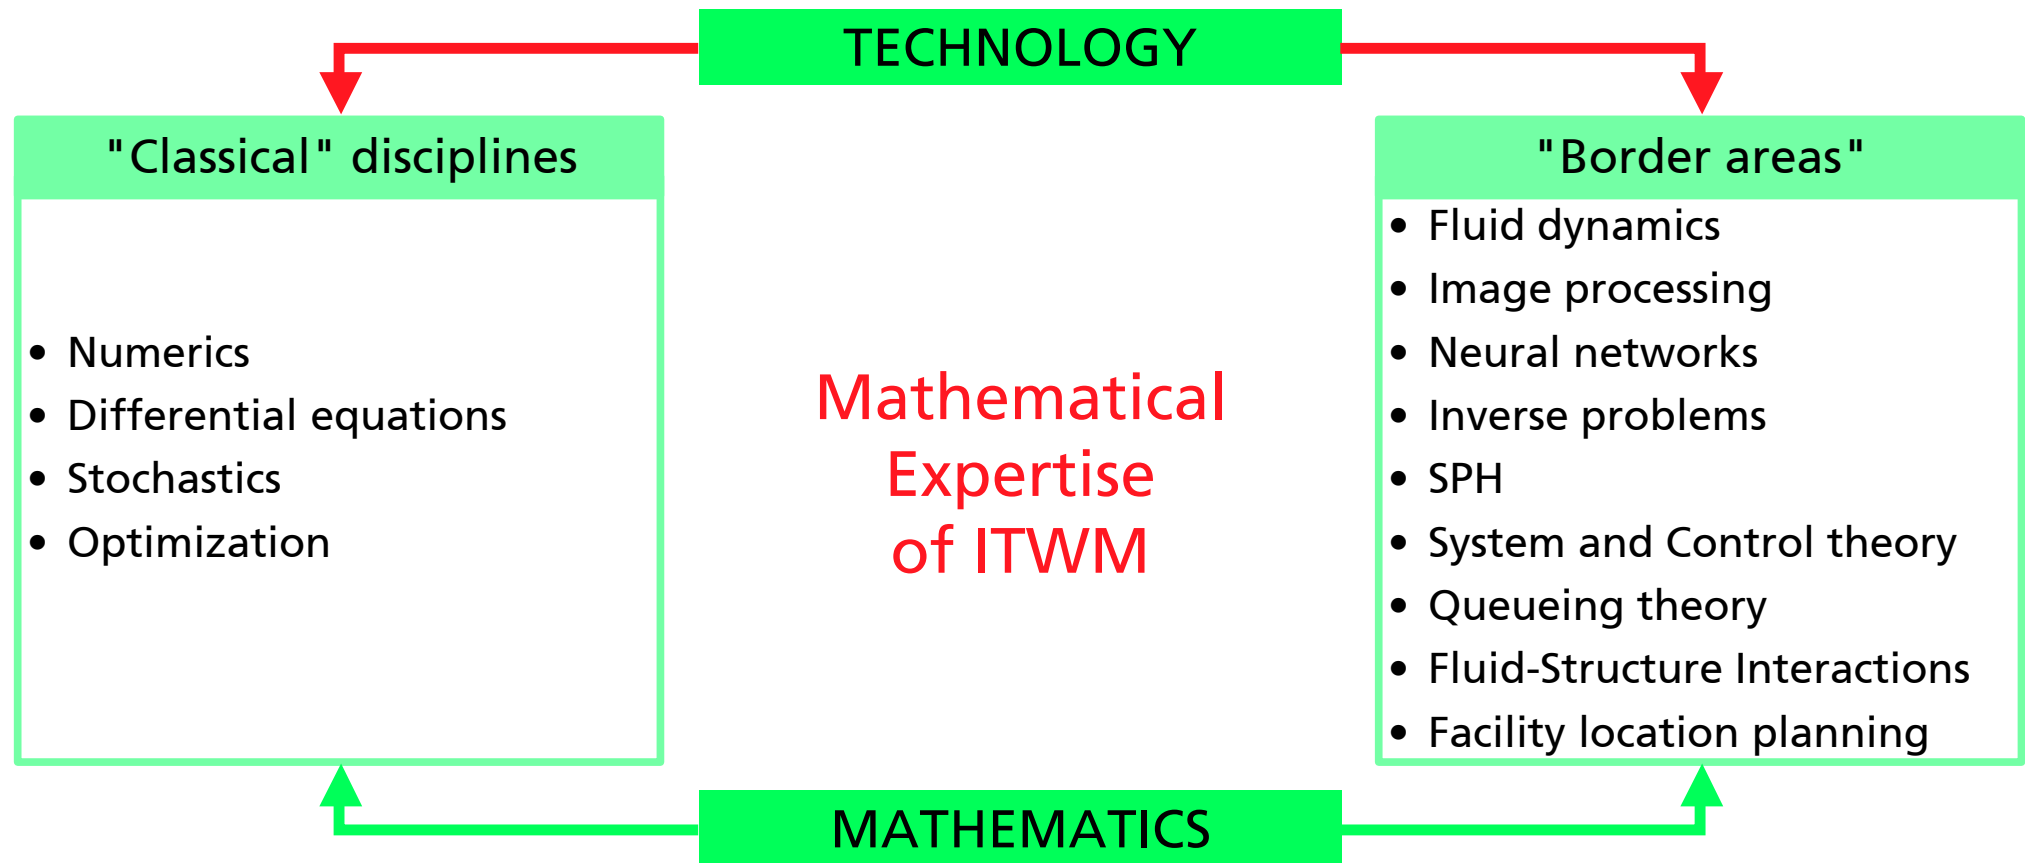

# Introduction: Fraunhofer ITWM

## Mathematics as a key technology

# Introduction: Fraunhofer ITWM

## Scientific Exchange and Mathematical Expertise

# Introduction: Fraunhofer ITWM

## Department "Flow and Complex Structures"

- Simulation of porous material
  - Moisture and heat transport
  - Filtration and design of filters
- Virtual material design
  - Microstructure simulation
  - Resistivity, acoustic absorption
- Filling processes
  - Simulation of casting processes
  - Fiber reinforced plastics (Injection moulding)
- Flood & risk management
  - Municipal sewer systems

# Introduction: Fraunhofer ITWM

## Department "Models and Algorithms in Image Processing"

- Surface inspection
  - Structured, also coloured surfaces (e.g. wood, paper, steel)
- 3D-Image analysis
  - Geometric characterization of 3D-structures
  - Modelling of microstructures
  - 3D-image processing
- Image / video compression
  - Wavelet based methods
- Autonomously working monitoring systems
  - Fast signal processing
  - Monitoring for railway systems

# Introduction: Problem

---

*Acoustic trim for the interior of the car:  
Headliner made of fleece*

## Optimization of the microstructure of non-woven acoustical trim

### Objectives:

- Optimal acoustic absorption spectrum
- High mechanical stiffness
- Light weight
- Easily recyclable material
- Low material and manufacturing costs
- Desired haptics/optics of the product

### Application:

Interior of vehicles,  
e.g. headliner

# Introduction: Requirements

---

Upcoming laws of the EU on end-of life vehicles require at least 85% of an automobile's weight to be recycled.

However, the acoustic trim of vehicles is currently produced from composite materials which are difficult to separate.

The goal of the "Integrated Product Policy" (IPP) project at the Fraunhofer ITWM and its partners Audi, Sandler, and Faurecia is to develop improved acoustic trim, which is made of single materials, by using innovative computer simulations.

Parameters used in the simulations are calibrated with acoustic measurements on real trims.

# Introduction: IPP

---

## Integrated Product Policy (IPP)

The entire life cycle of a product from its production up to its recycling is considered.

The effects on the environment during the entire life of the product are taken into account additionally.

*Closed product life cycle*

# Direct and Inverse Simulation

---

## Direct Simulation

### Given:

- Averaged geometric properties of the microstructure
- Geometry of the product (in an AutoSEA2 model)

### Find:

- Absorption spectrum for the interior of the vehicle

### Simulation steps:

- Stochastic geometry of microstructure
- Fluid dynamics in the microstructure
- Acoustic absorption 1D (material)
- Acoustic absorption 3D (product)

## Inverse Simulation

### Given:

- Desired absorption spectrum
- Desired geometry of the product (in an AutoSEA2 model)

### Find:

- Optimal material and its microstructure

### Solution steps:

- Precomputing a database for varying material properties by direct simulation
- Find the best fitting materials from the database (by using interpolation)

# Direct Simulation: Geometrical properties of the microstructure

*Micrograph*

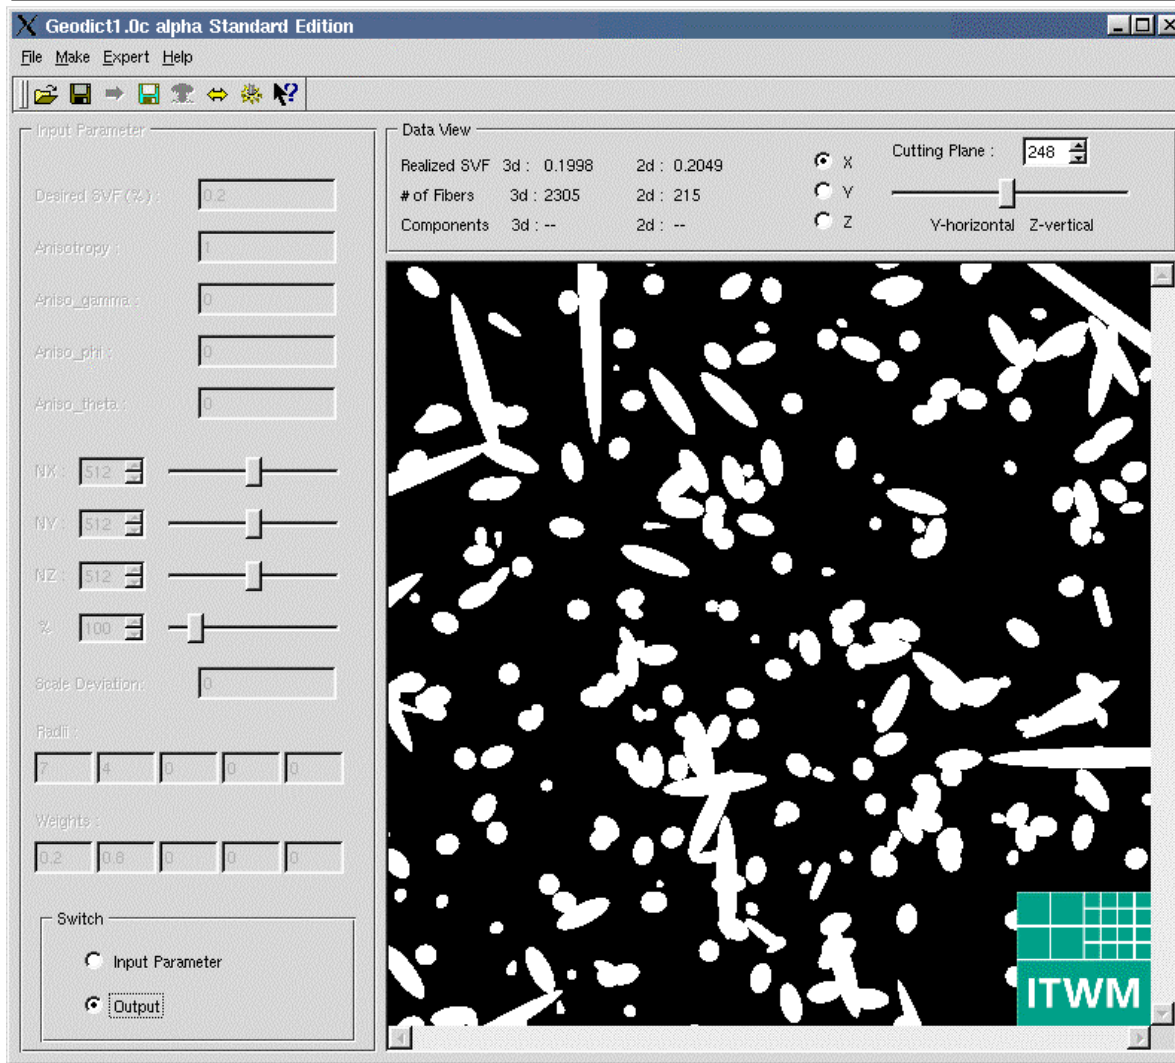

Properties:

Fibre shapes  
Fibre diameters  
Fibre distribution  
Porosity  
Anisotropy  
etc.

*Model of the microstructure  
(from the computer simulation)*

# Direct Simulation: Geodict

## Geodict

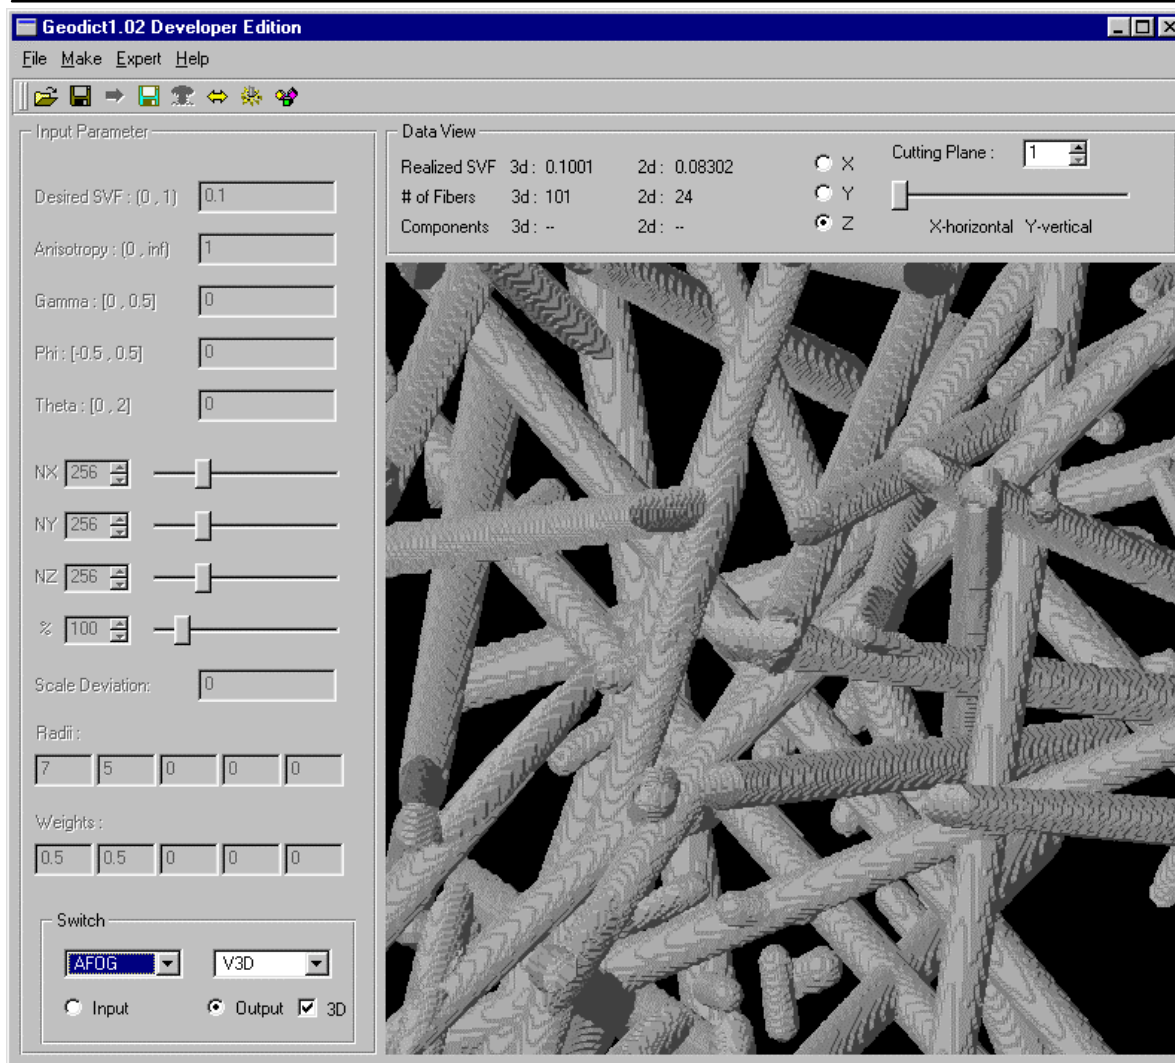

- generates stochastic microstructures (as input for computational fluid dynamics) interactively
- generates 3d surface data for microstructures in STL and VRML format

*GUI with cross section of the generated microstructure*

# Direct Simulation: Geodict

Input parameters for the microstructure

- solid volume fraction
- anisotropy model and directions
- up to 5 different fiber radii with weighting factors
- fiber length and cross section
- overlapping or non-overlapping objects
- resolution in x-, y-, z-direction

*GUI with 3D view on the generated microstructure*

# Direct Simulation: Geodict

---

*Examples of microstructures generated by Geodict*

# Direct Simulation: Fluid Flow

---

*Free flow through thin fleece of cylindrical fibers*

Input: Stochastic geometry model of the microstructure from Geodict (and further material parameters)

Solution of the (Navier-)Stokes equations

Algorithm: Lattice Boltzmann Method (LBM)

Software: PARPAC (Fraunhofer ITWM)

Result: Flow Resistivity

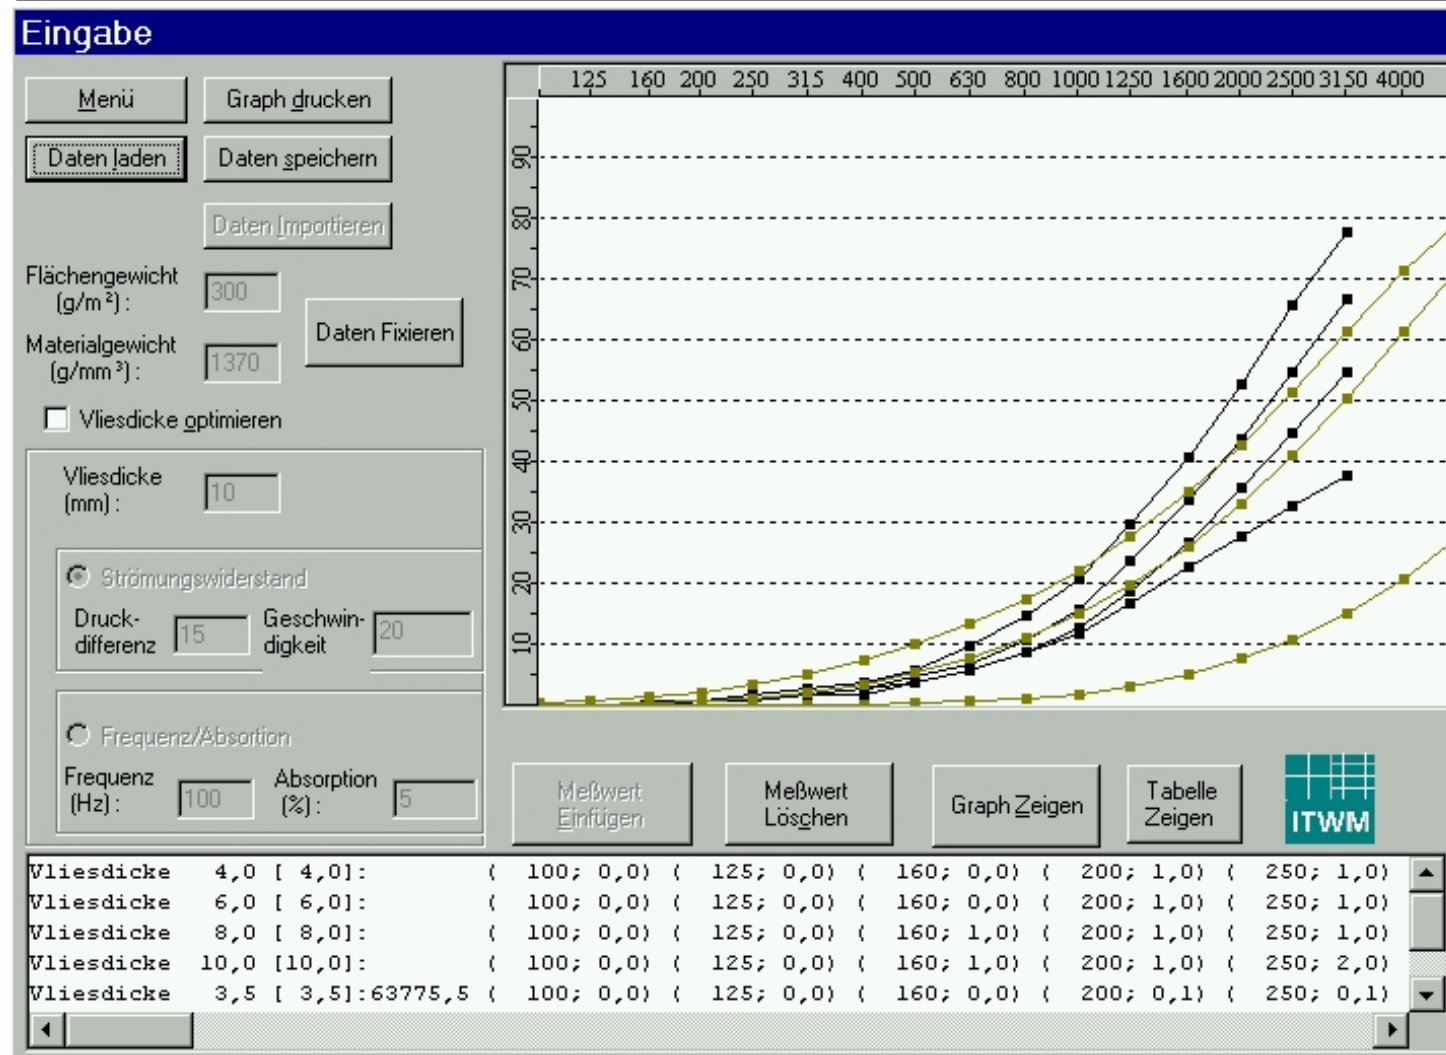

# Direct Simulation: Fluid Flow

*Comparison between  
Stokes/Navier-Stokes  
computations and  
measurements*

# Direct Simulation: Akudict

Akudict is a tool for the prediction of that acoustical absorption, which is measured in the impedance tube, for non-wovens.

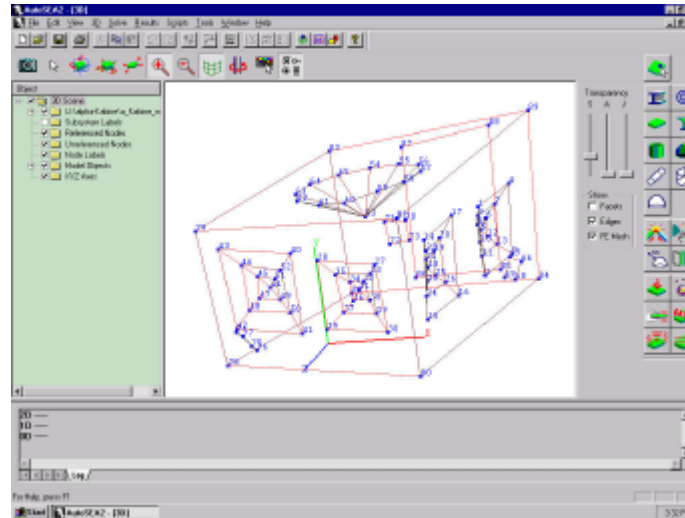

*Input form for the flow resistivity and measurements in the impedance tube*

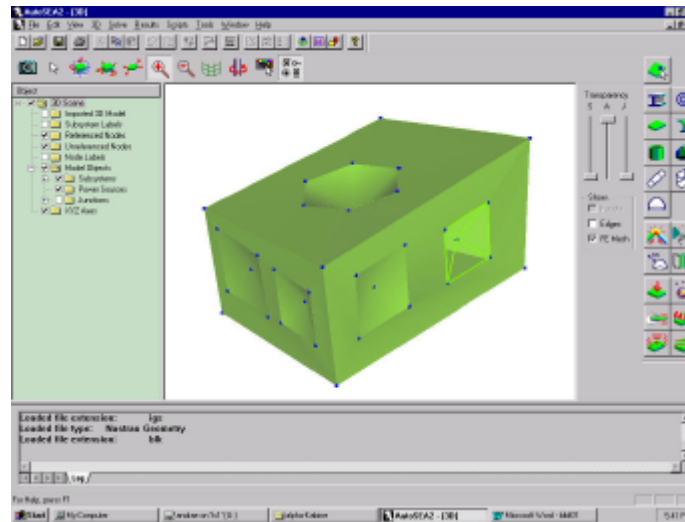

# Direct Simulation: Akudict

# Direct Simulation: Alphadict

Measurements in the Alpha Cabin are used to calibrate the absorption of the acoustical trim in the diffusive field.

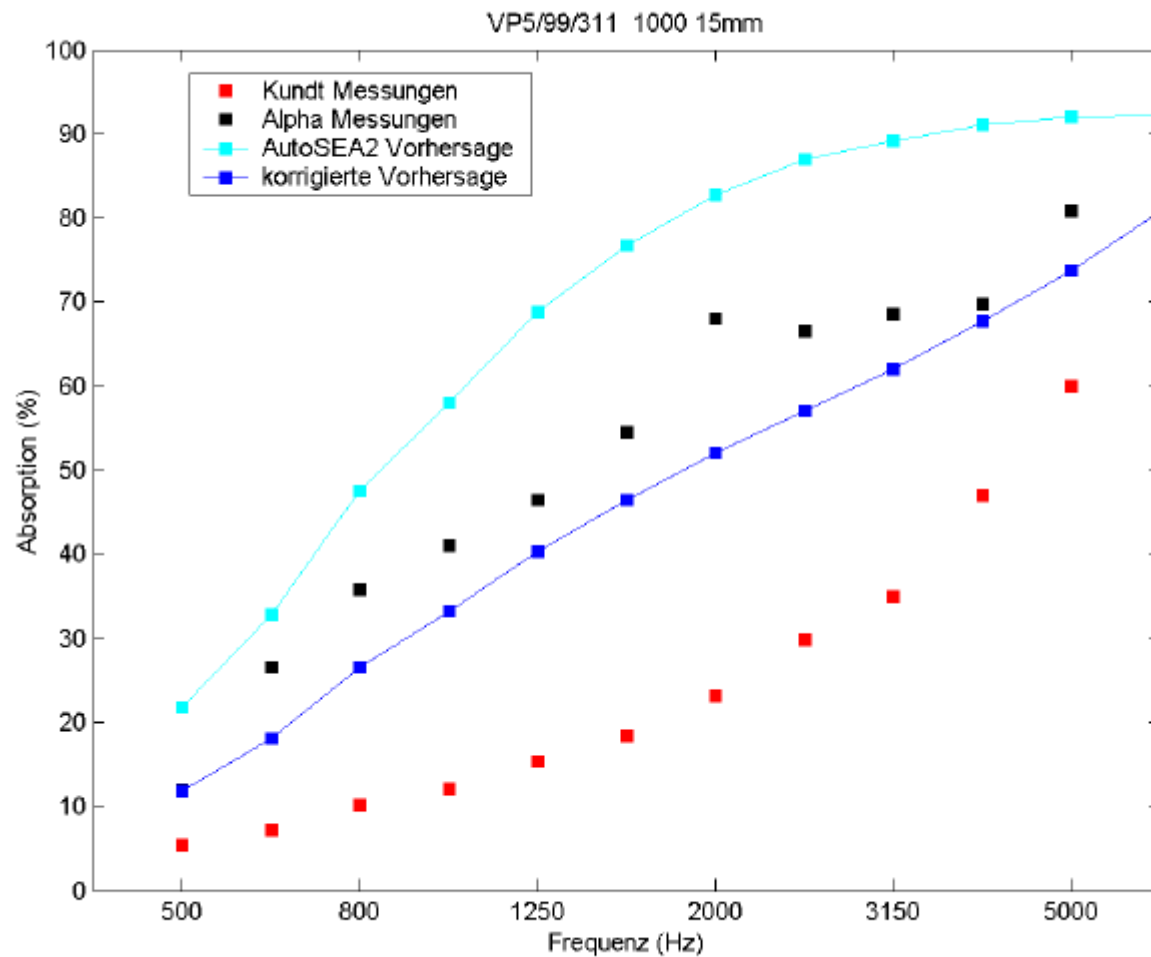

An simple SEA model of the Alpha Cabin was implemented.

# Direct Simulation: Alphadict

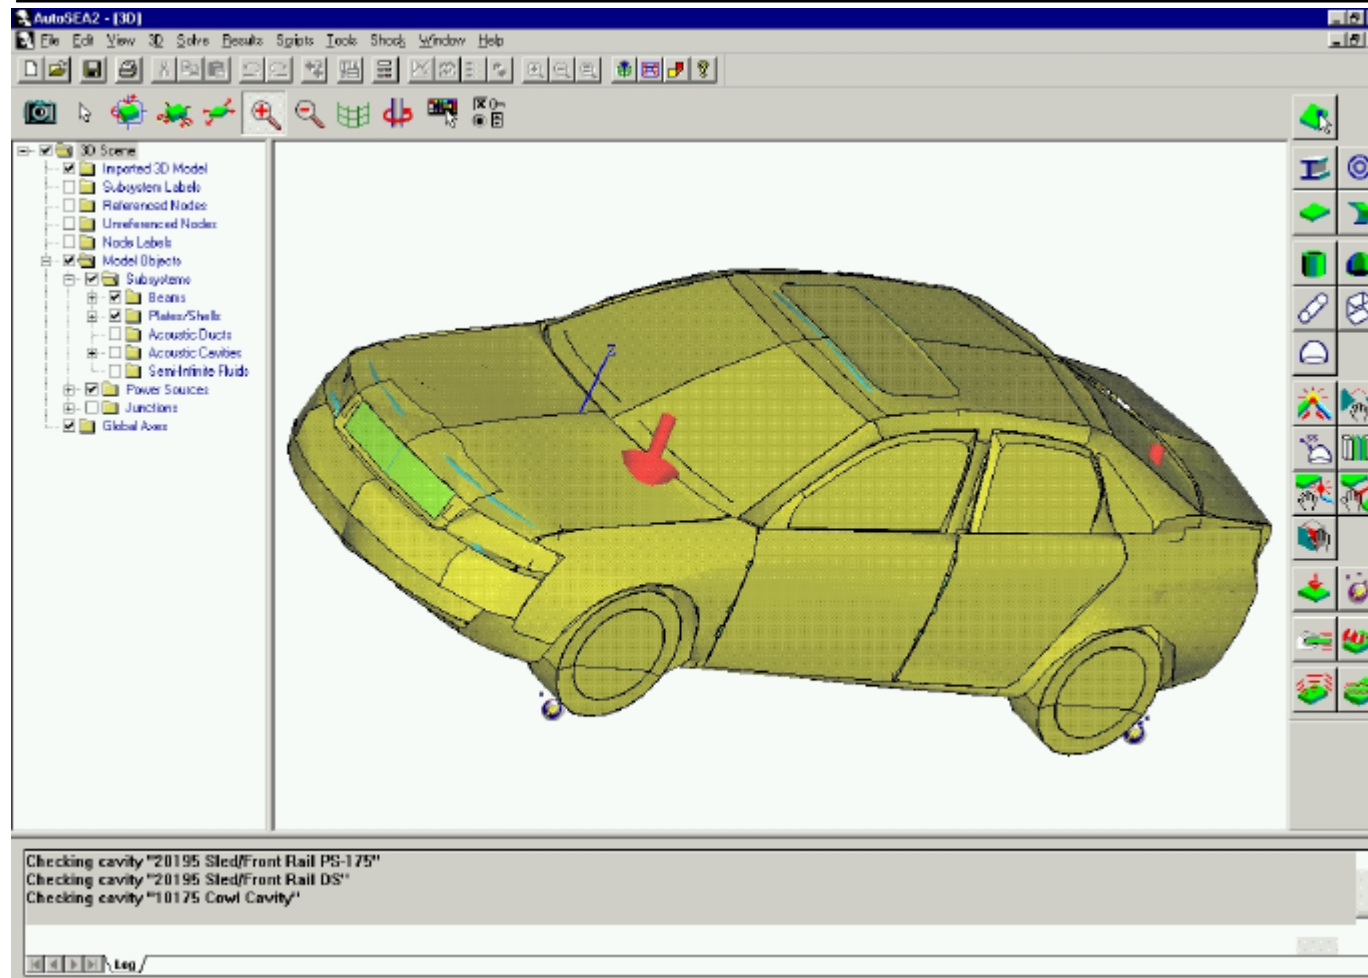

- Red Measurements: Impedance Tube
- Black Measurements: Alpha Cabin
- Light Blue Simulation: AutoSEA2
- Blue Simulation: Corrected Simulation with 2 parameters

# Direct Simulation: AutoSEA2

The influence of the acoustical trim part on the acoustical absorption of the passenger cabin is modeled by SEA.

A fixed number of acoustic experiments is considered.

*AutoSEA2 model from Audi/MSXI*

---

# Inverse Simulation

The computational effort for the direct simulation (especially for the fluid flow simulation) is very high.

The solution of the inverse problem requires several direct simulations.

Therefore, we compute a database, which contains for varying material parameters the corresponding absorption spectra in the vehicle, in previous.

By using this database, the solution of the inverse simulation is computed in few seconds.

# Inverse Simulation: Material Database

**Database**

<input type="button" value="Write Input File for Data Base"/>			

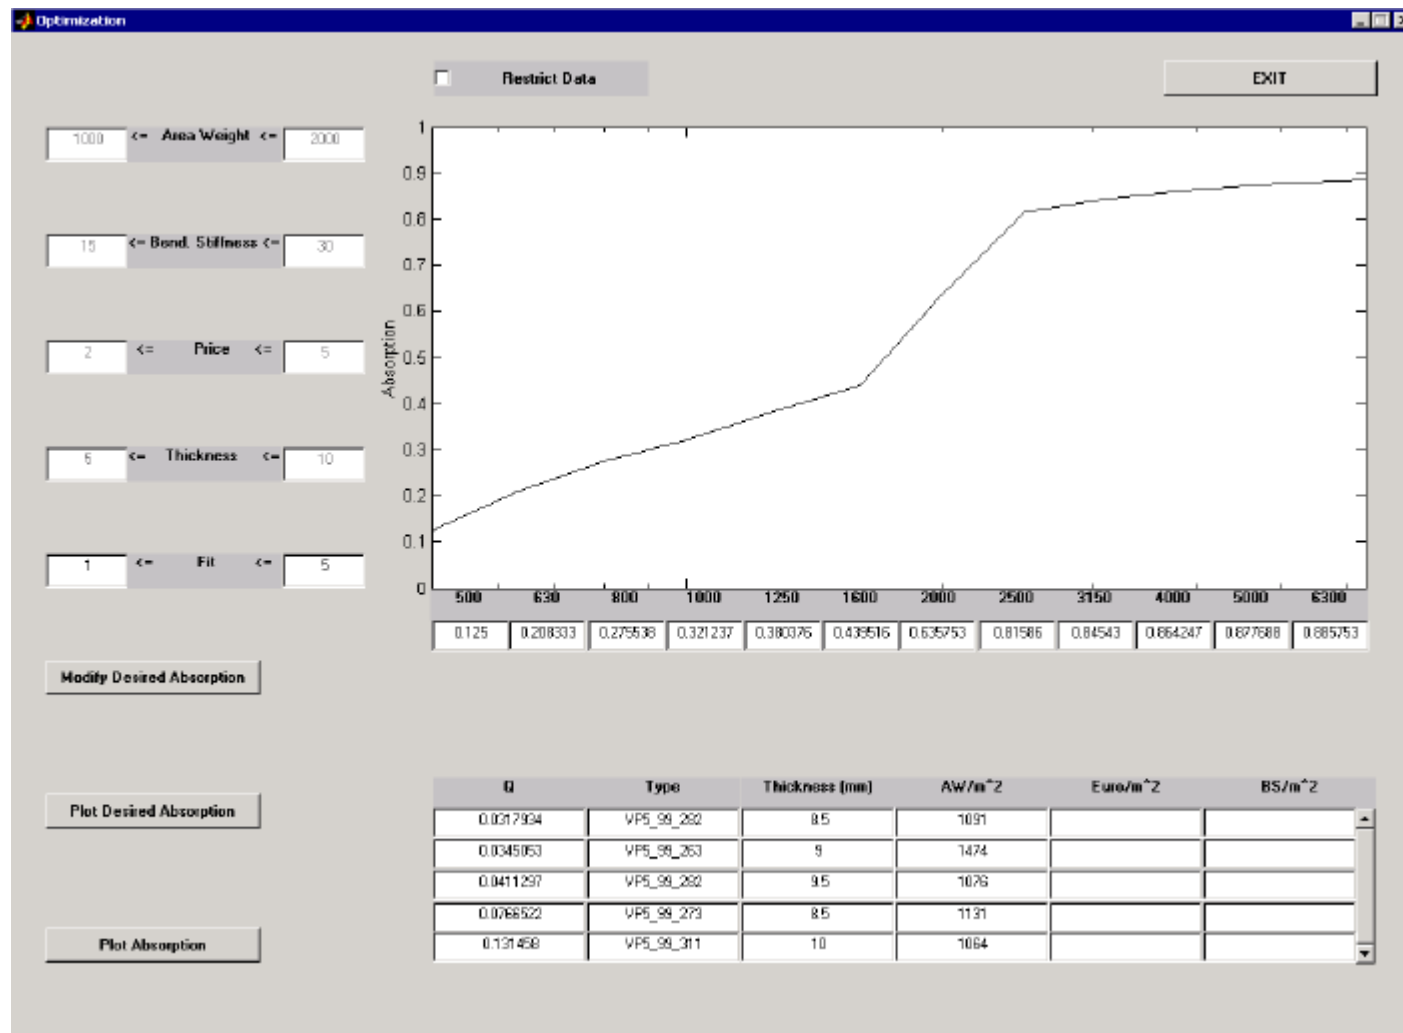

The Absorption spectrum is precomputed for varying material parameters (design variables) and for fixed experiments.

WWW and Matlab interfaces are used for SEA-Simulations.

*WWW interface for the generation of the optimization database*

# Inverse Simulation: Constraint Minimization Problem

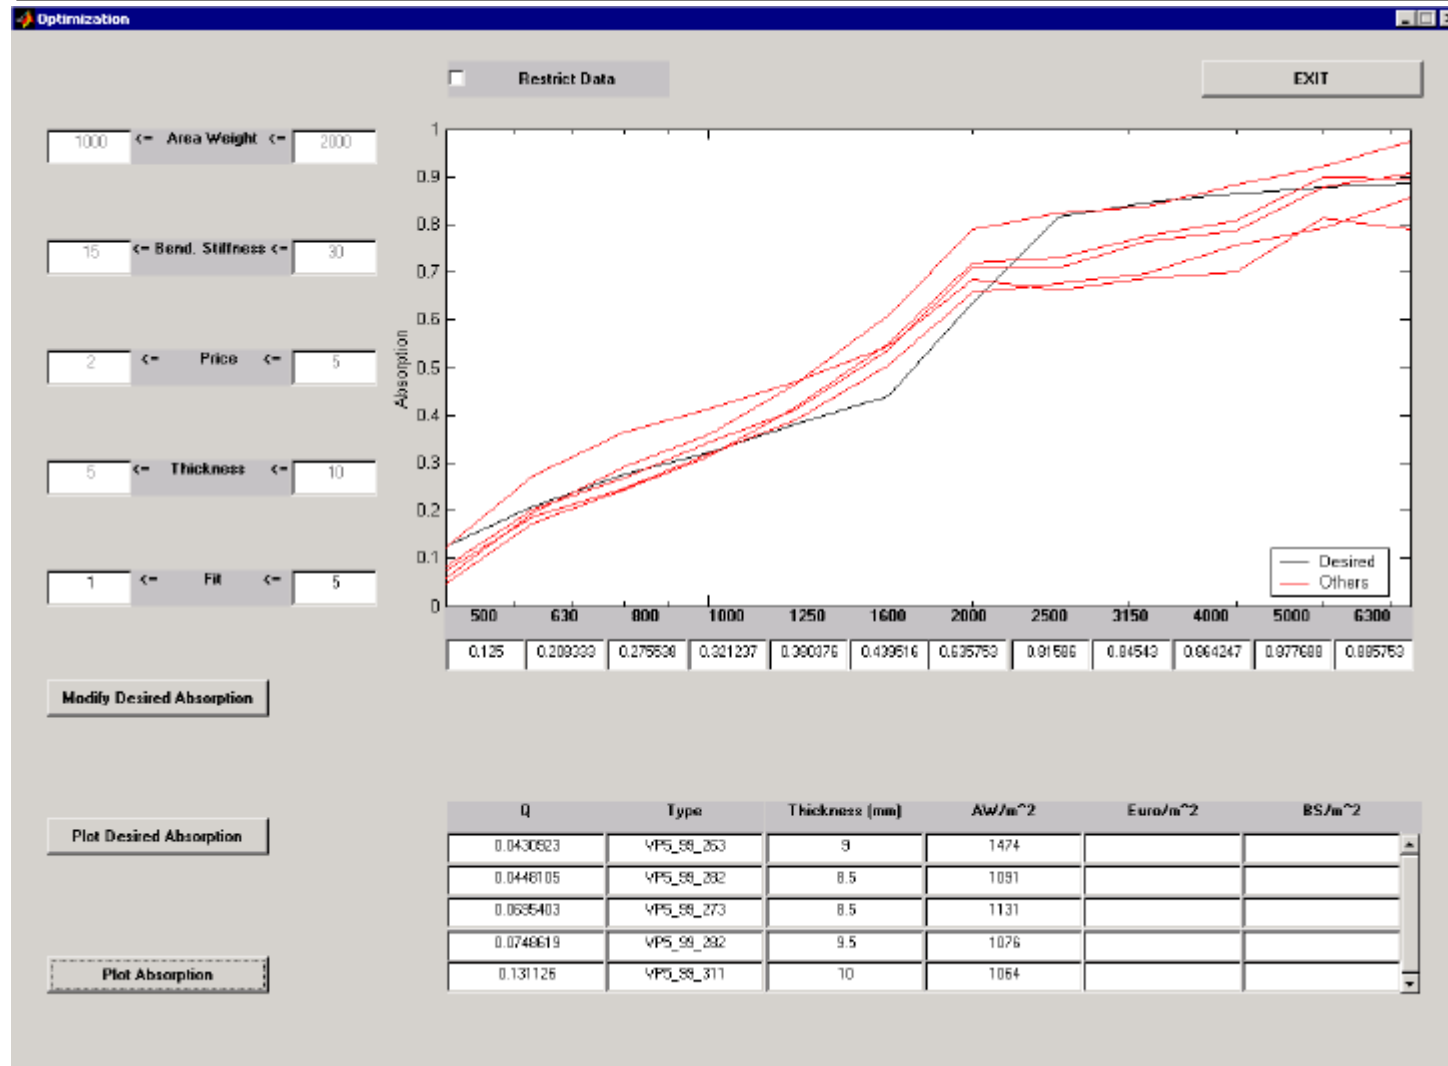

Input form for the design of acoustic trim parts (e.g. headliner):

1. Objective function: Desired absorption spectrum
2. Constraints: Weight, Bending stiffness, etc.

*GUI for the solution of the Constraint Minimization Problem (CMP)*

# Inverse Simulation: Constraint Minimization Problem

The table at the bottom right side shows the best fitting materials with their absorption spectra plotted in red color. The desired spectrum is Plotted in black.

*Solution of the Constraint Minimization Problem (CMP)*

# Summary
